The Circularity Assessment Protocol (CAP)

The Circularity Assessment Protocol (CAP) is a hub and spoke model that provides a snapshot of a city's circularity that can provide data for local, regional, or national decision-making to reduce leakage of waste (e.g., single-use plastic) into the environment and increase circular materials management.

circularityinformatics.org

What questions do we ask for each component?

INPUT

What products are sold in the community and where do they originate?

COMMUNITY

What conversations are happening and what are the stakeholders' attitudes and perceptions?

PRODUCT DESIGN

What materials, formats, and innovations are found in products, particularly packaging?

USE

What are the community trends around use and reuse of product types?

COLLECTION

How much waste is generated, what does it comprise, how is it disposed? How much is collected and what infrastructure exists?

END OF CYCLE

What is the fate of waste once it is properly discarded? How is it treated?

LEAKAGE

What waste ends up in the environment? Why and how is it getting there?

CAP are in progress or completed in
56 cities and **16 countries.**

Information sharing

The local community's knowledge and expertise is honored. Partners and teams build capacity through learning methods and collaboration. [Debris Tracker](#) is an important tool that is used by researchers and the community alike. Open data is important to the process.

Data analytics

Data for each city's CAP is analyzed and co-owned by the researchers, city and sponsors. Trends across cities, countries and regions can illuminate global narratives and influencing factors.

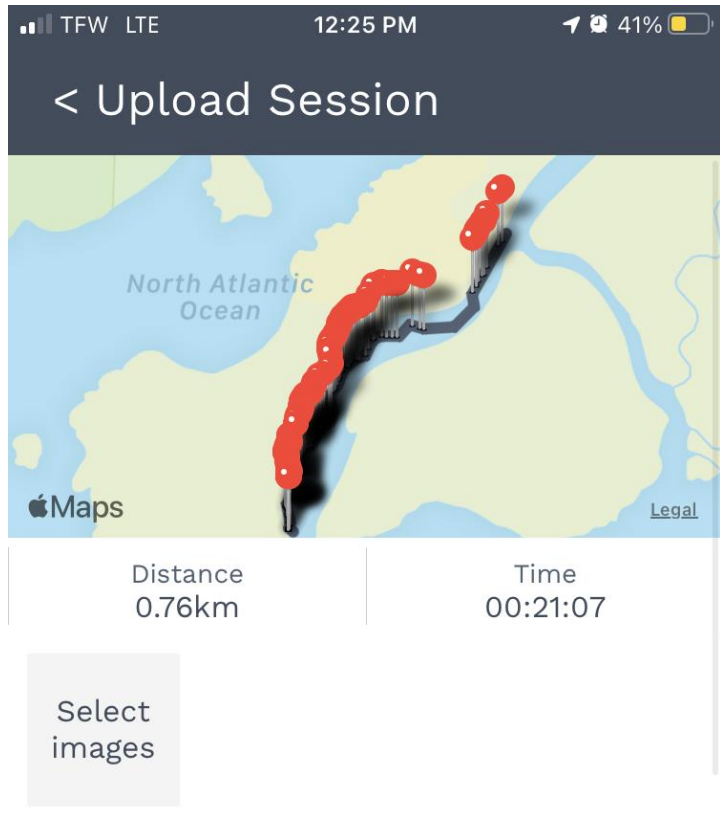

Empowering communities

Communities are empowered by local and global CAP data to inform their decisions about what is working - or where and how to intervene to increase circularity. Communities that participate in CAP can better define resource needs and participate in knowledge exchange.

Systems change

Information is power that can result in community-based systems change, measured by the Circularity Informatics Lab.

Marine
Debris Tracker
Powered by Morgan Stanley

Debris Tracker is an open access mobile app used by the field team to collect geospatial data for the CAP. Anyone can categorize litter and contribute data to a free online database showing litter around the world.

Source, sea and sink—A holistic approach to understanding plastic pollution in the Southern Caribbean

Abstract

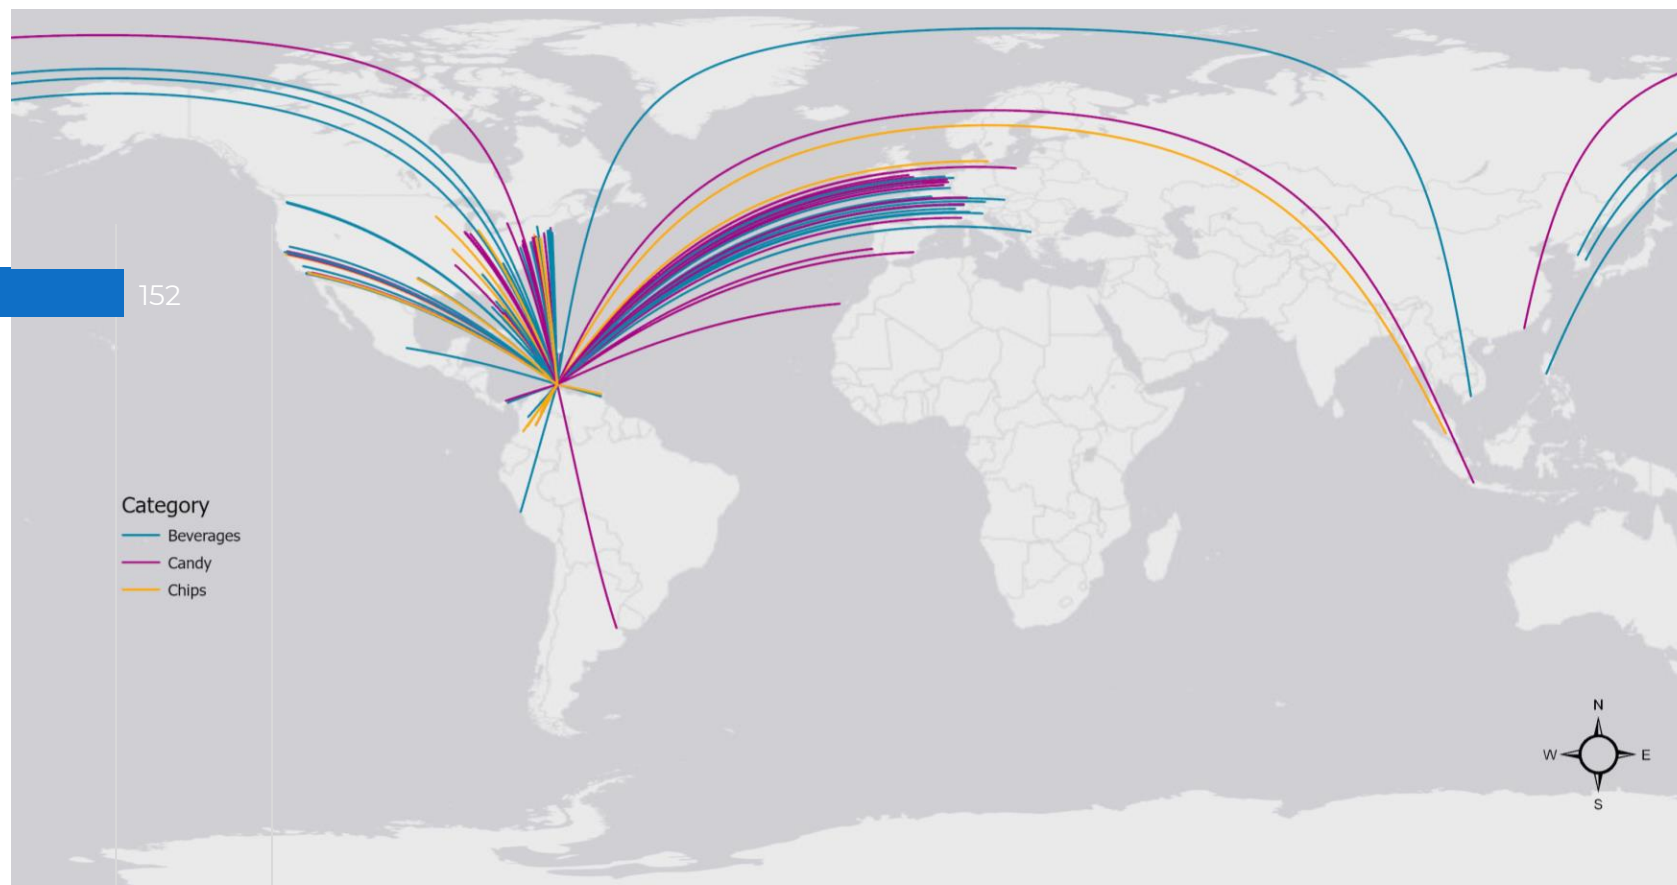

The circular economy has been promoted as a solution to plastic pollution, but cities and communities bear the brunt of plastic pollution. The Circularity Assessment Protocol (CAP) is a systems method of collaborative and open data collection for communities to use for decision- and policy-making. The CAP has been utilized in 51 cities in 14 countries and is illustrated here in Metro Manila. Results include identifying manufacturing and parent companies to bring to the table; documenting most (77%) products are in single-use multi-layer film packaging; a small, but growing formal refill and reuse system; 10% of to-go food containers composed of paper-based alternatives, and a snap-shot leakage concentration of plastics to the environment that is 1.8%–2.7% of current waste generation. Community narratives emerged from a collaborative workshop and are
